# Background

---

- **Exact causal pathways between race, poverty and health remain unclear**
- **Health disparities have been linked with:**
  - Availability, organization and utilization of resources
  - Community culture and physical environment
  - Individual stressors, coping mechanisms and behaviors
- **Birth outcomes are considered one of the most sensitive health indicators**
- **Individual factors have been the primary focus, to date.**

# Research Questions

---

1. What is the cooccurrence and spatial distribution of race, poverty and birth outcomes within a single county across urban and rural areas?
2. What is the relative strength of race and poverty, at the individual and the community-level, to predict birth outcomes?

# Methods

---

- **Secondary Data Analysis**
  - Individual-level: 2010 birth certificate data
  - Community-level: 2010 U.S. Census data (census tracts)
- **Kalamazoo County, Michigan, U.S.**
  - Census tract shapefile downloaded from Michigan Geographic Data Library (<http://www.mcgi.state.mi.us/mgdl/>)
- **ArcGIS 10.0**
  - Geo-coded individual-level birth records using maternal address
  - Then linked to census tract data through a spatial join
  - Generated maps illustrating interrelationship of race, poverty and health
- **Analysis**
  - Spatial: Bayesian Spatial Modelling with Conditional Autoregressive Priors (using R package)
  - Linear Regression: Hierarchical Modelling (using SPSS v21)
  - Significance: Two-sided, significance level set at  $p < .05$

# Study Populations

## Predictors of Census Tract LBW

	Median	Confidence Interval
Blacks >20%	0.71	0.05, 1.45*
Poverty > 20%	-0.15	-0.93, 0.40
tau	0.85	0.01, 2.79
rho	0.45	0.03, 0.93

\*Statistically Significant at 95% confidence level

**Acceptance rate: 35.7%**

# Study Limitations

- **Unit of analysis may not represent meaningful community boundaries**
- **Small census tract sample size**
- **Predictor measures are very broadly defined**
- **May be missing variables that confound or mediate the relationship between race, poverty and health**
- **Individual and community-level race (and poverty) may be too interrelated to tease apart their independent contributions to health**

# Summary

- **Black race, poverty and low-birth-weight are highly correlated**
  - Within individuals and within communities
  - Illustrated by spatial clustering as well as statistical significance
  - With the tightest, strongest cluster in the urban core of the county
  - But a potential second cluster of LBW communities in areas marked by neither poverty nor higher black residency

U.S. Census Bureau, 2010

# Summary - Tentative

- Race appears to be a better predictor of LBW than poverty
- An individual's own circumstances (i.e., their race and their poverty) more strongly predicts LBW than the characteristics of the community in which they live
- Living in a more concentrated Black community is associated with additional LBW risk, when considered with either individual race or poverty alone
  - But an individual's race and poverty-status, together outweigh any community risk
- Given how deeply intertwined these risk factors are at the individual and community level, it is very difficult to isolate relative risk of race and poverty, at the individual or the census tract levels
